Migrate Figma Assets to Pixso

An ultimate cloud solution to design assets migration

Glossary

Migration Tool

A Script that runs on Figma workspace and generates a .BIN file

Matching (Members)

After uploading a .JSON file, assigning every Pixso member to one Figma member, so to inherit Figma teams, projects, and files iin Pixso

Migration record

A record created after a .JSON file is uploaded and member matching is completed

Migration status

Statuses that reflects the migration progress, comprised of "In Progress" and "Completed"

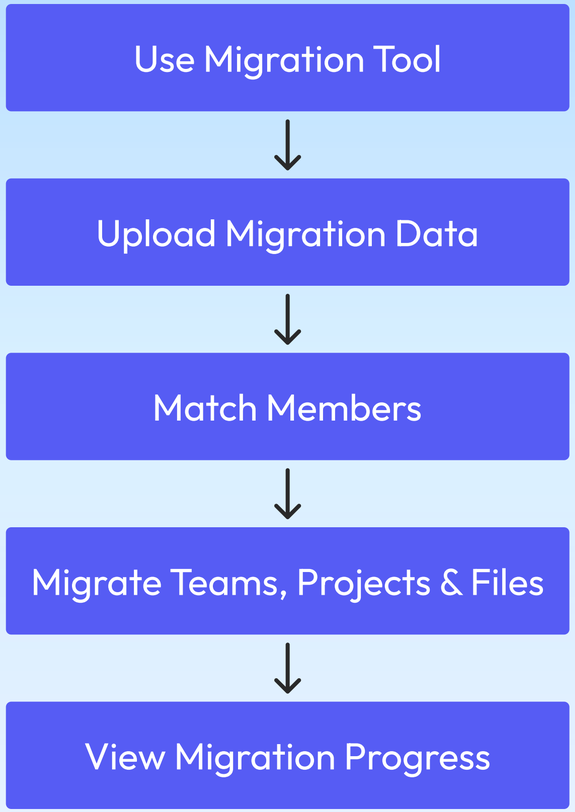

Migration Management

A feature that allows enterprise admins to upload .BIN files, match members, and view migration status

Introduction

Understand the basic process and get started quickly

Start studying →

Introduction

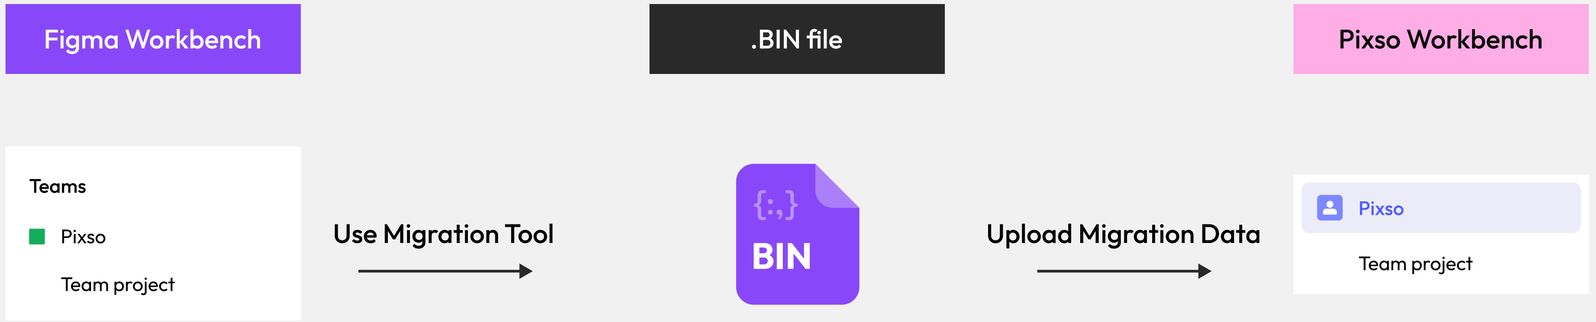

Supports team-level migration of projects, files, members

You should use migration tool, fill in **access token**, select teams to migrate, upload **.BIN** files and match members to migrate

After a migration record is generated, the data is processed in cloud and is independent from your log-in status or network environment

Supports multiple enterprise admins to submit migration request respectively

The firstly-submitted request data prevails if data of same teams/projects/files exist in various requests

Tips Before Migration

- Assess your enterprise assets at Figma
  - Teams: Confirm the usage of all Figma teams by your enterprise members, and list teams that need to be migrated
  - Projects: Confirm if there is any invite-only project; if so, ensure that members of the private project participate in using the migration tool to ensure asset completeness
  - Files: Move important files located in drafts into team projects, and restore important files located in the "Deleted" that need to be migrated
  - Members: Remove members who departed/become invalid/do not need to migrate to Pixso from team member lists, project collaborator lists, and file collaborator lists

- Assess team status to confirm migration priority
  - Inactive (teams with slow update of design files, few use of components and style from library files, and low member turnover frequency): it is recommended to migrate inactive teams first, so as to observe and compare the effect of asset migration
  - Active (teams with fast update of design files, constant use of components and style from library files, and high member turnover frequency): members under active teams need to be notified before migration that, during the migration process, any team-, project-, and file-level modification should be suspended to avoid data errors

- Use Google Chrome browser during the migration

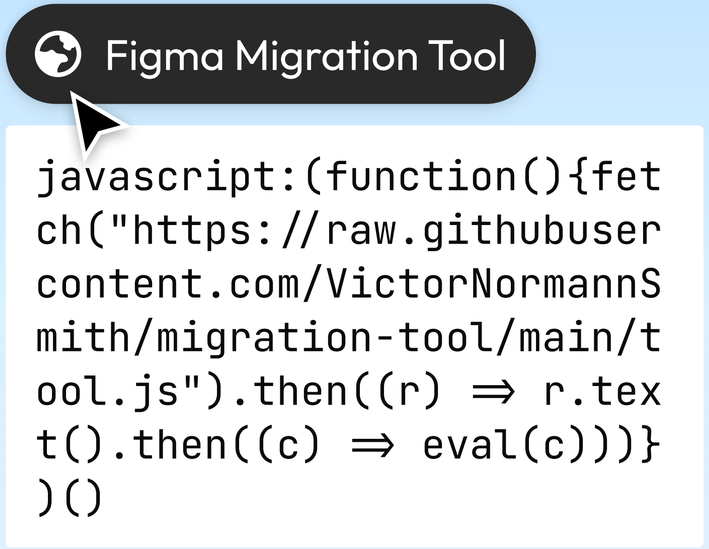

- (Apply to private deployment users) Prepare resources for Figma Migrating Service
  - Standalone version: Reserve additional 8G memory at least for the service
  - Cluster version: pod
    - Memory: Request 8G (at least) Limit 12G/16G/or more (determined by free memory)
    - CPU: Request 1.0 Limit 2.0/3.0/or more (determined by free memory) (parallel jobs = cores)
    - Parallel tasks are automatically scheduled based on surplus resource

- If there is any question about the above tips, please contact your Pixso customer success manager for further advice and insights

Use Migration Tool

Data export, quick and easy

Understand tool →

Use Migration Tool

Script Code:
javascript:(function(){fetch("https://raw.githubusercontent.com/VictorNormannSmith/migration-tool/main/tool.js").then((r) => r.text().then((c) => eval(c)))})()

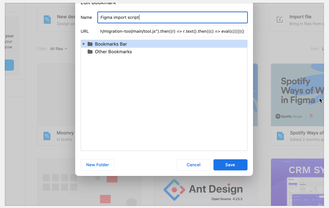

Copy the code above and manually create a new bookmark in your browser.

Open your Figma workspace and click the bookmark you just created to run the tool.

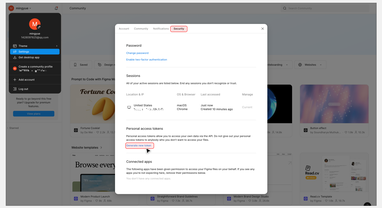

Fill in your Figma access token
(How to get Figma access token)

Select the teams you want to migrate to Pixso and click "Next"

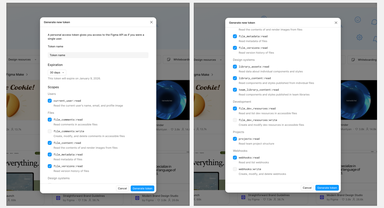

① Copy the code on the left to add a browser bookmark.

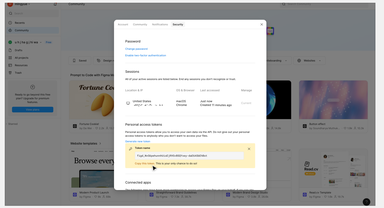

② Go to **Settings > Security > Personal access tokens** and click **Generate new token**.

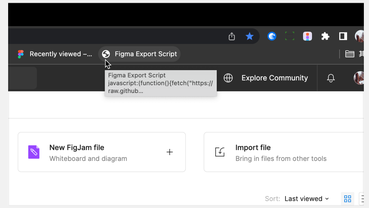

③ Name your token, select all **Read** permissions, and click **Generate token**.
***Note:** We recommend setting the expiration to **30** days or longer.

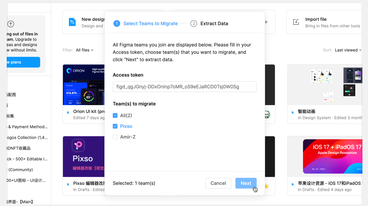

④ Copy the generated access token.

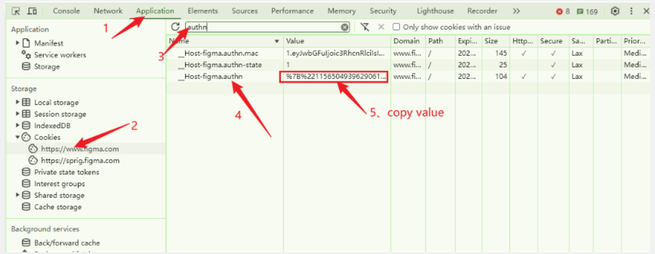

⑤ Click the bookmark you just created to run the tool.

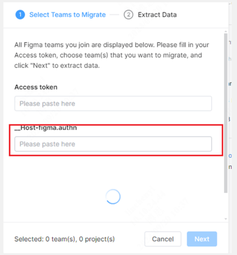

⑥ Paste your **access token**, select the teams you want to migrate to Pixso, and click **Next**.

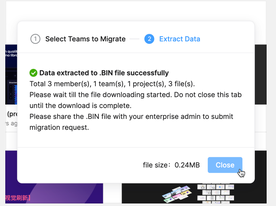

⑦ Retrieve the **__Host-figma.authn** value as shown below:
(Open **Developer Tools > Application > Cookies**, select the **Figma URL**, search for "**authn**", and copy the **value of __Host-figma.authn**)

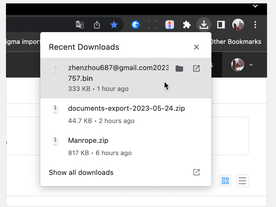

⑧ Enter the __Host-figma.authn value.

⑨ Wait for the data to be successfully extracted into the **.BIN** file and click **Close**

⑩ After successfully extracting the **.BIN** file, select the save path to complete the file download

FAQs

Q: How does migration tool work?

A: By running the migration tool, data in Figma is saved as a .BIN file. The file includes teams, projects, files, and collaborators and can be migrated to Pixso after being uploaded to Pixso.

Q: What is the scope of a migration?

A: It covers the tool user's accessible teams, projects, design files, as well as team-level, project-level, and file-level collaborators.

Q: Who can use this migration tool?

A: Any Figma user, with editor or viewer seat, can use the migration tool.

Q: Can one user run this migration tool for several times?

A: Yes. Different .BIN files will be generated every time you run the tool.

Q: How many members from our enterprise should use the migration tool?

A: We recommend members that have joined most teams of your enterprise use the migration tool to ensure a full coverage.

Q: When I use the tool, it shows error message "Extract data failed: timeout of 60000ms exceeded". What does this mean?

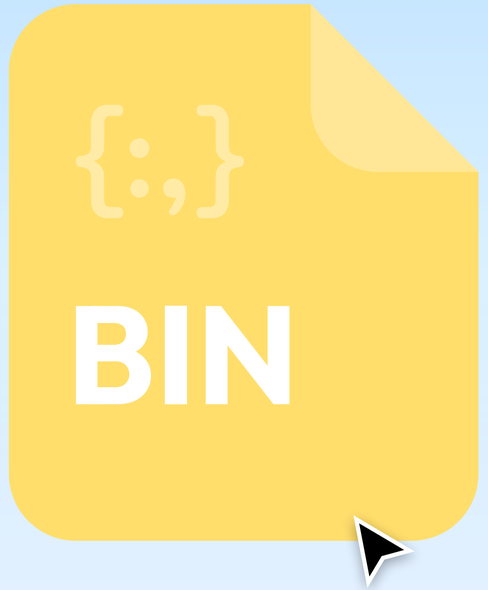

A: This error indicates that your assets may be too large to finish extracting within a time limit set by the browser. Here are some tips for resolving:

- Close other applications in your device and other tabs in the browser, and then retry
- Select fewer teams to migrate at one time, and then retry
- Contact Pixso customer success manager for further support

Upload Migration Data

Data in .BIN files from Figma to Pixso

Start studying →

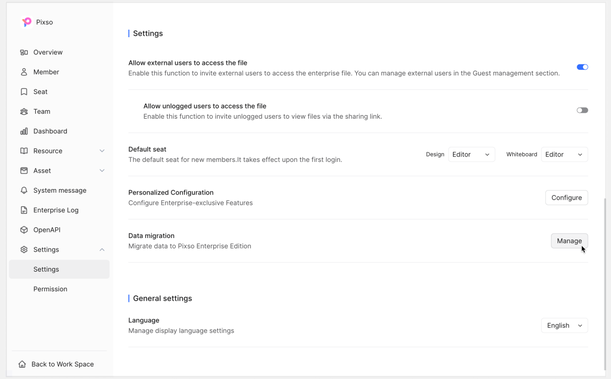

Upload Migration Data

Find the .BIN file and share it with your enterprise admin

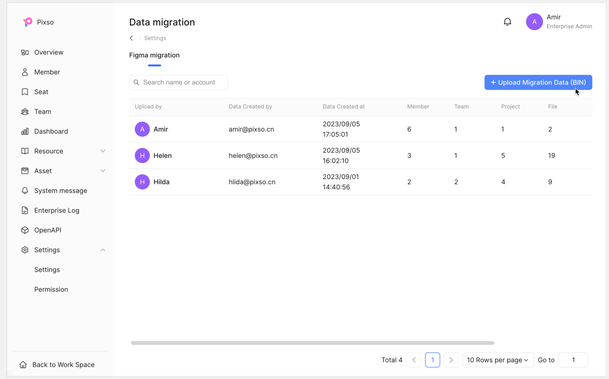

Enterprise admin visits Pixso workspace and enters "Enterprise Management" at the lower left corner. Select "Migration management" and click "Start to Migrate" to upload the **.BIN** file.

Data in the .BIN file expires in 10 days after being generated, so it is recommended to upload .JSON files and finish member matching to start migration as soon as possible.

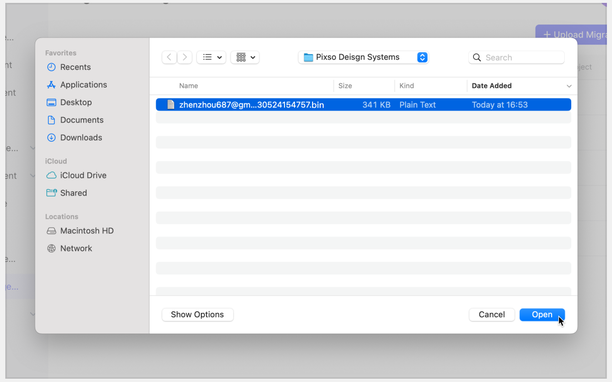

① Select **Settings**, scroll down and click **Data migration - Manage**

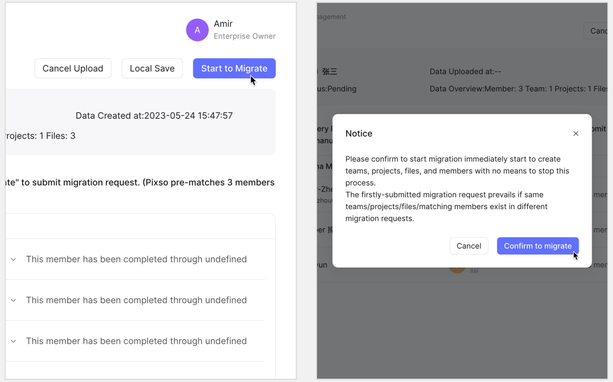

② In "Figma migration" tab, Click on the "Upload Migration Data (BIN)" button

③ Pop-up window to select the **.BIN** file to be uploaded

④ Click on Start Upload and select **Confirm Upload** in the pop-up window

FAQs

Q: Who can upload the migration data? Where can I upload the data?

A: Enterprise owner and enterprise admins can upload the migration data **at Enterprise Management - Migration Management - Upload .BIN file.**

Q: Can I upload several .BIN files at once?

A: Yes, an enterprise owner/admin needs to match Figma members with Pixso members for every .BIN file to launch migration.

Q: We have several enterprise admins. Can they upload data at the same time?

A: Yes, every enterprise admin can upload a .BIN file at a time.

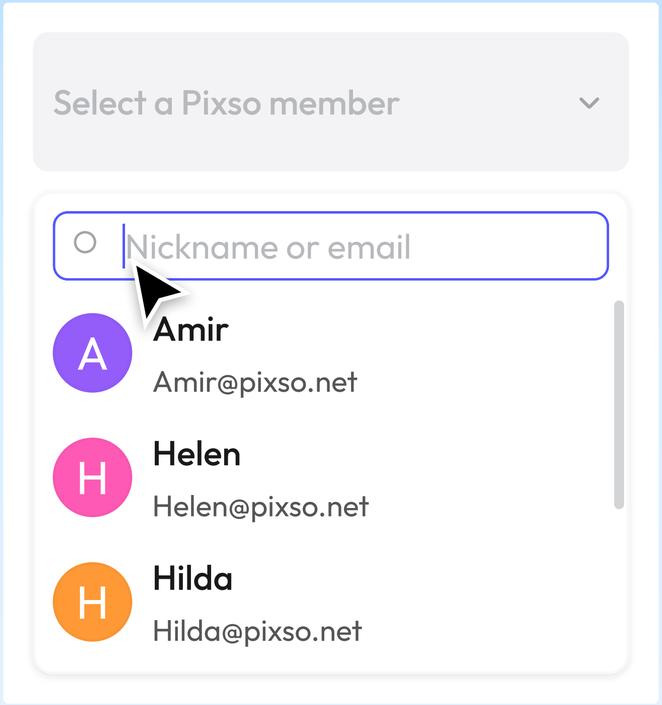

Q: May I upload the same .BIN file for many times?

A: After members are matched and before a migration is launched, the system examines if the same team/project/file have been created by previous migration records. If yes, the existing team/project/file will not be created again to avoid redundancy.

Match Members

Preserve members and collaborators for teams, projects & files

More about matching →

Match Members

Pixso generates a list of Figma members based on data in a .BIN file and displays a list of Pixso members.

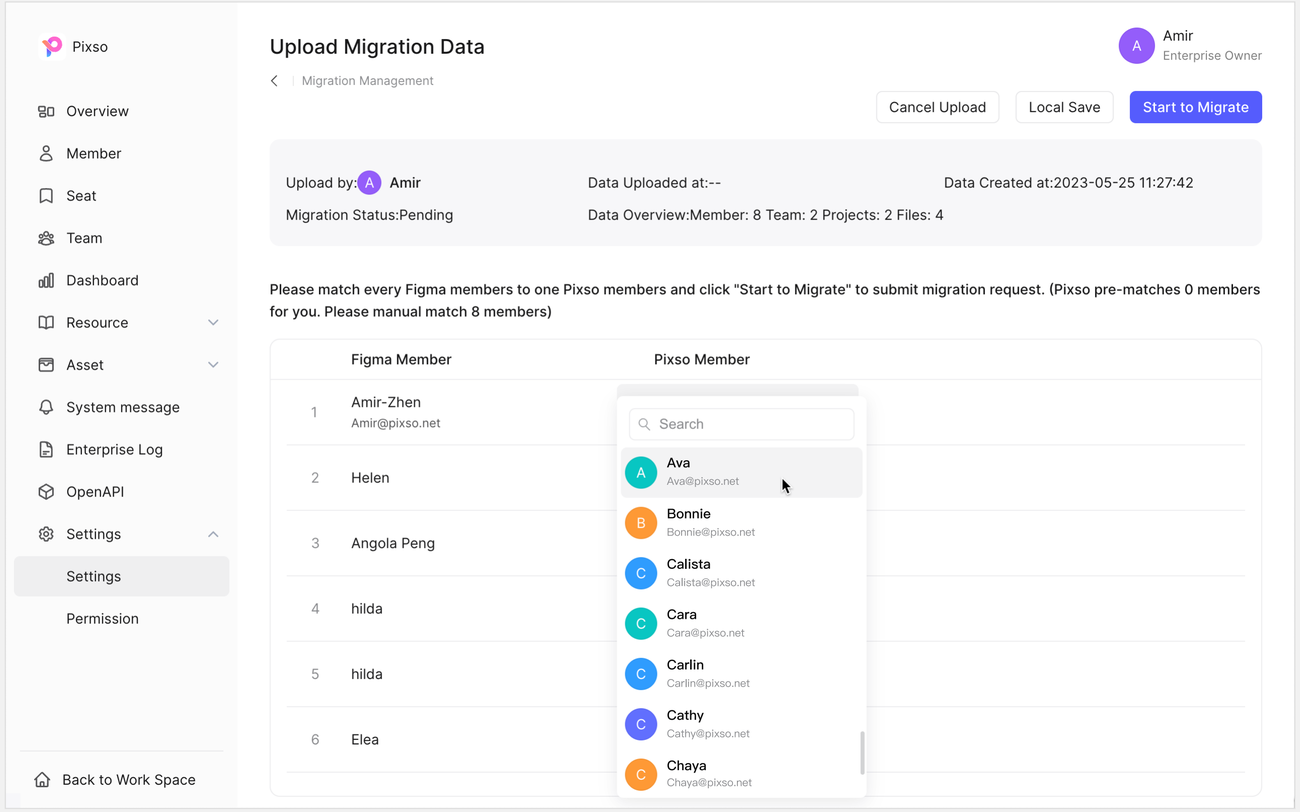

The enterprise admin should match every Figma member with a Pixso member. When generating the member list, Pixso will pre-match and recommend matching members. You can then manually match members as you wish.

If you would like to finish member matching later without discarding what you have edited, you can click "Local save" to temporarily save the matching data in your browser. Please note that the matching data will not remain if the account is switched or a different device/browser is used.

The enterprise admin, at one time, can only upload one .BIN file and match members within it before you submit migration request. You can click "Cancel " to discard the matching data you have edited to start another migration.

You can click "Start to Migrate" to start the migration after every Figma members are matched with one Pixso members.

Matching member page

FAQs

Q: Must every Figma member be matched with a Pixso member?

A: Yes, the migration can only be launched after every Figma member is matched with one Pixso member.

Q: What should I do with the Figma members that are departed employees?

A: You can match this kind of Figma members to the successor Pixso user as a hand-over. The Pixso user will become the owner of that Figma user's teams, projects, and files.

Q: What if several enterprise admins launch migration at the same time with one Figma member matched with different Pixso members?

A: If different matching records are submitted at short time, the earliest-submitted one prevails.

Q: What if I accidentally match wrong members? How can I fix it?

A: After a migration is launched, data modification is not possible. A pop-up notification will remind enterprise owner/admins of re-examining data before matching result submitted successfully.

If you notice the wrong matching results after a migration is complete, enterprise owner/admins can use the **Asset Handover** feature to transfer asset ownership from one Pixso member to another as a fix. Also, enterprise members themselves can use **Transfer Ownership** feature in the workbench to transfer certain teams, projects, and files.

Migrate Teams, Projects & Files

Migration on cloud, no manual efforts required

Recap on migration →

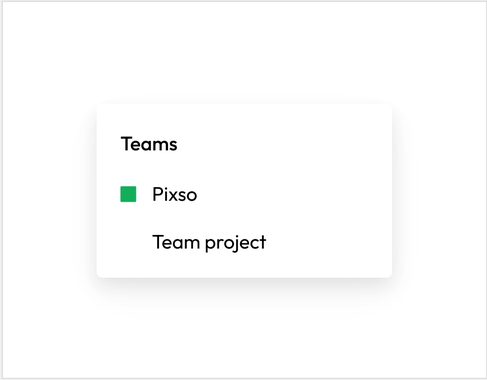

Migrate Teams, Projects & Files

After a migration is started, a migration record will be generated with the "In Progress" status. Now you can upload a .BIN file, match members, and submit a migration request again, after which another migration record will appear.

After migration requests for all your assets are submitted, all you need is to wait for migration completed. Now let's take a look at the right side to recap on how the migration solution works:

① Open Figma Workbench

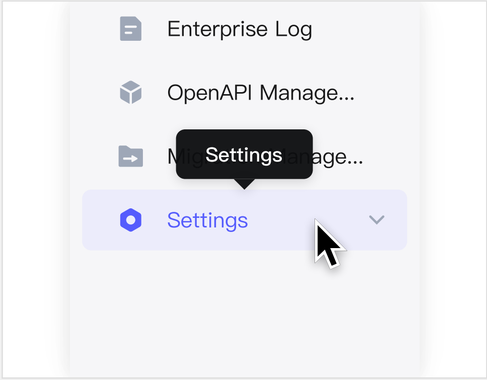

② Use migration tool

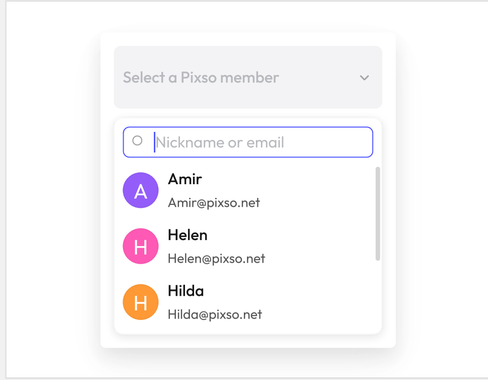

③ Get a **.BIN** file

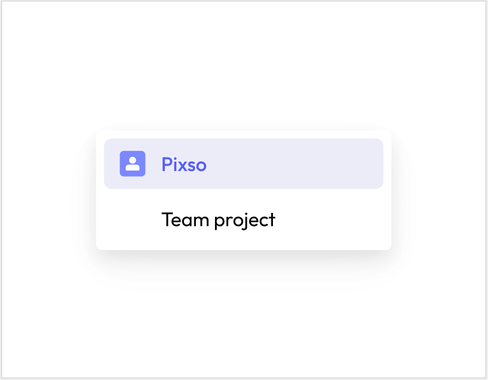

④ Upload via **Settings**

⑤ Match Members

⑥ View assets in Pixso Workbench

FAQs

Q: Can libraries and design files remain connected after migration?

A: Yes.

Q: What if there are overlapped team/project/file in different user's .BIN file?

A: Existing team/project/file will not be recreated to avoid redundancy.

Q: What if several enterprise admins launch migration at the same time with one Figma member matched with different Pixso members?

A: If different matching records are submitted at short time, the earliest-submitted one prevails.

Q: I already used **Component Library Import** and **Import File** feature to migrate part of my Figma files, and I have created some teams and projects in the same name as those in Figma. Will these existing asset affect migration?

A: Pixso's new migration solution will not delete or modify the files you imported via **Component Library Import / Import File** feature, nor will it overwrite the teams and projects you have manually created.

Q: Can I continue to use **Component Library Import** and **Import File** feature after using this migration solution?

A: Yes, you can.
**Please be noted that libraries and design files imported via different features are unable to remain connected.

Q: What if I want to migrate my files in Figma's **Draft** or **Deleted**?

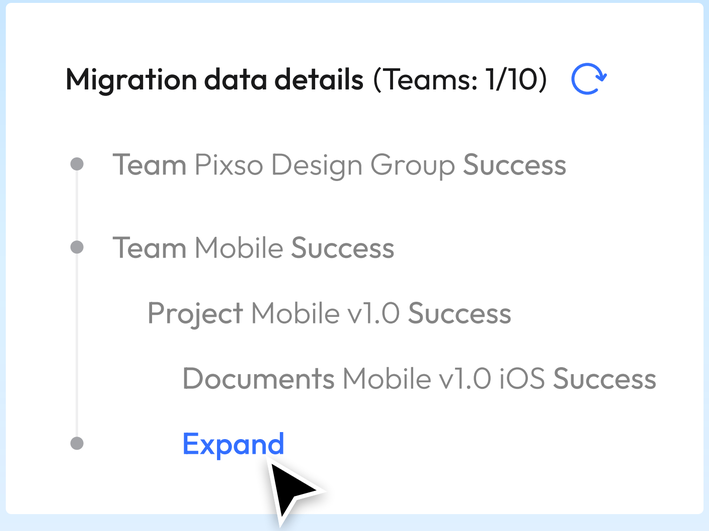

A: Technically, files in Figma's **Draft** or **Deleted** cannot be migrated as the migration tool can only extract data on a team basis.

If you do want to migrate them, we suggest you create a team or a projects, move the files in Figma's **Draft** or **Deleted** into it, and select this team when you use the migration tool to include them.

View Migration Progress

Click any time to see the migration progress

More about progress →

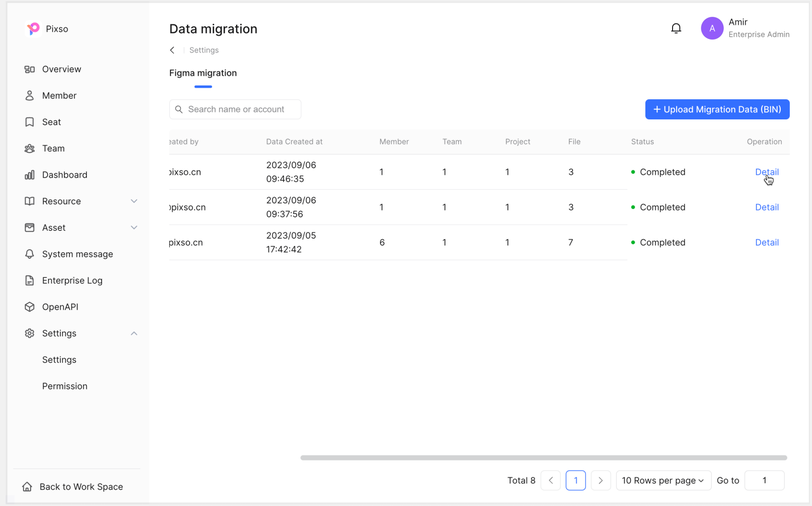

View Migration Progress

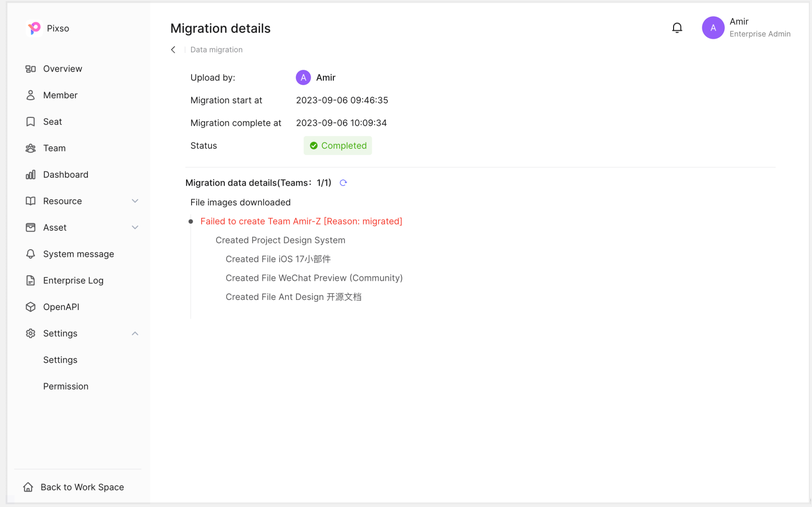

With the migration in progress, you can click "View Details" anytime to check specific results of creating teams, projects, and files. Migration time depends on the volume of data in a .BIN file. Please wait until the migration is completed.

The status of a migration record will switch from "In Progress" into "Completed" when the migration is completed.

① Click to **view details**

② Query Migration Status

FAQs

Q: During the migration process, must I keep my device on/network connected/browser open/account logging-in?

A: After a migration is launched, Pixso will handle this request on server, so you can feel free to leave Pixso, close your browser, or turn off your device.

Q: Can I stop a migration in progress?

A: No.

Q: Can I view the fail-to-migrate reason of a certain team/project/file?

A: Yes, there will be error message in the migration progress. Please refer to the Error Message Reference (and suggested solution) below.

- **migrated**: This team/project/file has already been migrated (you can check if this team/project/file already exists at Pixso; if you want to migrate again, delete the team/project/file and initiate a migration again)
- **download file failed file size is 0**: Fail to download this file since its size is 0 (the original Figma file is likely to be an empty file; if so, you can ignore this failure as there is no need to migrate empty files)
- **get file failed**: The file link has expired (use the migration tool again and upload the latest .BIN file)
- **execute cpp error: Errors occur when migrating this file to Pixso (you can provide this file copy to Pixso for troubleshooting file-level errors)**
- **get image failed**: Errors occur when downloading image(s) of the file (you can provide this file copy to Pixso for troubleshooting file-level errors)

Best Practices

Examples to get started quickly

Start practicing →

+ Upload Migration Data (BIN)

Best Practices

Let Figma members that join most teams to use migration tool

Enterprise admins can cooperate in a division of teams to upload .BIN files from specific teammates

Modify invite-only projects to open projects to ensure a full coverage for migration data

Upload .BIN files and finish member matching as soon as possible to ensure the migration is completed within 10 days (before the data expires)

Migrate the teams that the files within are less frequently modified to help you compare the original assets with the new ones in Pixso.

Examples

Take PIX Design as an example:

PIX Design would like to migrate their assets from Figma to Pixso

PIX Design's assets in Figma are listed in the table below

Amy uses the migration tool. She selects all the teams she has access to (**Web App**, **Design System**) and generates a .BIN file. Amy has joined the invite-only projects **V2.0** and **Workshop**, so these two projects will be covered.

Diana and Grace uses the migration tool, as they are respectively responsible for migrating **Mobile App** and **Desktop App**, the two teams that do not include in Amy's scope. Two .BIN files are generated.

Brian, Cindy, Edwin, Frida, Henry, and Irine does not need to use the migration tool, as their accessible teams, projects, and files have been covered in Amy, Diana, and Grace's scope.

Amy, Diana, and Grace send their .BIN files to William, the enterprise admin of PIX Design. He uploads these 3 files one by one into Migration Management panel in the Enterprise Management, finishes member matching and launches 3 migration records.

During the migration process, enterprise members notice that teams, projects, and files are generated one by one.

NO	Teams	Team members	Projects	Project collaborators	Documents	Document Collaborators
01	Web App	**Amy**,Brian,Cindy	V1.0	**Amy**,Brian,Cindy	Web 1.0	**Amy**,Brian,Cindy
			V2.0	**Amy**,Brian,Cindy	Web 2.0	**Amy**,Brian,Cindy
02	Mobile App	**Diana**,Edwin,Frida	V1.0	**Diana**,Edwin,Frida	Mobile	**Diana**,Edwin,Frida
03	Desktop App	**Grace**,Henry,Irine	V1.0	**Grace**,Henry,Irine	Desktop	**Grace**,Henry,Irine
03	Design System	**Amy,Diana,Grace**	Library	**Amy,Diana,Grace**	Library	**Amy,Diana,Grace**
			Workshop	**Amy**,Edwin,Henry	Workshop	**Amy**,Edwin,Henry
